

**In the Abstract:**

*Please amend the Abstract as follows:*

--The invention relates to a method of providing address information for reaching a wireless terminal, ~~said~~the wireless terminal being connected to a first wireless communication network, a varying public address being dynamically allocated to ~~said~~the wireless terminal, and ~~said~~the wireless terminal being reachable from outside of the first wireless communication network by means of ~~said~~the varying public address. The method comprises dynamically notifying substantially directly at least one other communicating party of a current public address of the wireless terminal.
